

FREE GUIDE

Motion design with Claude Code

The full method behind my "Claude's new Motion design" video, step by step.

My video got close to 30,000 views in a few days, and one question keeps coming back: **“how did you do it?”**. Here's the full answer.

Spoiler: there's no magic prompt. There's a method — a well-told story, a precise brief, and back-and-forth with Claude until it runs smoothly. You can do it too.

What you'll get

A 3D animation of about 45 seconds, in **a single web page**, that you play full screen and film with your phone.

What you need

- **Claude Code**, Claude's tool that writes code for you (included in paid Claude plans). I use it inside VS Code, but it also works in a terminal.
- **VS Code** (free), to open your working folder.
- **Google Chrome**, to play the animation.
- **Your phone**, to film the screen.
- **Your brand**: your colors, your fonts and your logo.

💡 No coding skills needed: you describe, Claude writes the code. You just need to open a folder in VS Code and a file in Chrome.

02 How it works, in one page

The highlight of my video: the dashboard exploding in 3D.

- **Everything lives in one HTML file:** the set, the screens, the camera, the captions, even the sounds. No After Effects, no Remotion, no library.
- **The 3D is pure CSS.** You build a “world” in perspective and place panels in it: an inbox, a client card, a quote, a phone... The camera is just that world moving.
- **Everything is driven by a clock.** A `render(t)` function computes where every element is at time `t`. The video is always identical, and you can jump to any second to fix a detail.
- **Sounds are generated by code** (pop, whoosh, chime) with the Web Audio API: no audio files, no rights to pay.
- **I film my screen** full screen in Chrome, in the dark, with my phone. That's what gives the glowing-screen look.

Your story

The brief

Claude Code writes the file

You watch and fix

You film

Step 1 — Story before tech

This is the most important step, and the one everybody skips. A beautiful animation with no story: nobody watches it to the end.

- 1 **Pick ONE transformation:** a before (chaos, manual work) and an after (everything happens on its own). Mine: a client sends a quote request by email, and everything follows without anyone retyping anything.
- 2 **Split it into 6 to 8 scenes of about 5 seconds.** One scene = one idea = one caption of 8 words max.
- 3 **Plan one highlight,** the image people will remember. Mine: the dashboard exploding in 3D with "Retyping: 0".
- 4 **End with your signature:** your logo, your name, one call to action.

My storyboard, as is

#	Time	What you see	Caption
1	0–5 s	A quote request email lands in the inbox	A client sends a quote request
2	5–11 s	The AI reads the email, highlights the info, six chips fly out	The AI reads the email and pulls out the key info
3	11–16 s	The chips land in the client card, which fills itself	The client card creates itself
4	16–22 s	The quote lines compute, the PDF comes out and gets stamped	The quote is calculated and laid out
5	22–28 s	A paper plane flies to the client's phone, who accepts	Sent to the client. Accepted in one tap.
6	28–35 s	Schedule, order, invoice and reminder follow	Everything else follows, nothing retyped
7	35–41 s	The dashboard explodes in 3D: "Retyping: 0"	Entered once. The rest is automated.
8	41–46 s	My logo, my name, the call to action	—

Step 2 — Your brand: that's what makes it YOUR video

Don't let Claude pick your colors: give it yours. I used the ones from my website and brand guide:

- **Fonts:** Space Grotesk for titles, Inter for text.
- **Logo:** my round logo, as a PNG.

Where to find yours

- In your brand guide, if you have one.
- Otherwise, straight from your website: right-click a title → **Inspect**. You'll see the font and the color code (#...).
- Give your logo as a PNG and ask Claude to embed it **inside** the file (base64): the animation will work even offline.

💡 Dark background + one single accent color = premium look on screen. It's also what looks so good when you film in the dark.

Step 3 — The brief (the famous “prompt”)

Here's the template I use. Fill in the brackets, then paste it into Claude Code. The more precise you are about what we see in each scene, the better the first draft.

Prompt 1 — the creative brief

[COPY & PASTE](#)

I want to create a [45]-second 3D motion design animation to show [what your product or automation does] to [your audience].

THE STORY

Before: [the problem, in one sentence].

After: [what happens with your solution, in one sentence].

Highlight: [the image people should remember].

THE SCENES (about 5 seconds each)

1. [What we see] — caption: "[8 words max]"

2. [What we see] — caption: "..."

3. ...

7. [What we see] — caption: "..."

End: my logo appears in the center, slides left, my name slides out from behind it, then "[your call to action]".

THE STYLE

- Very dark background with a bluish glow, floating particles and a grid floor fading into the distance.
- Colors: [#2563EB], [#60A5FA], [#0F1729]. Fonts: [Space Grotesk] for titles, [Inter] for text.
- Realistic interfaces (inbox, client card, quote, phone...) placed in space like dark glass panels.
- A cinematic camera: it glides from scene to scene, moves closer, turns slightly, with a subtle handheld feel.
- Every element appears with a small bounce. Nothing moves at random.

THE OUTPUT

- Numbered captions in a pill at the bottom, my logo and name at the top left.
- A start screen with a "Play the demo" button.
- Subtle sound effects (pop, whoosh, chime) generated in code, with the S key to mute them.

In my video: scene 2 (the AI reads the email) and scene 5 (the client accepts on their phone).

Paste this second block right after the brief. It's what separates a generic "AI" animation from real motion design.

Prompt 2 — the technical instructions

[COPY & PASTE](#)

Technical instructions:

- One self-contained HTML file: fonts and logo embedded in base64, no external library, nothing to install.
- A fixed 1920 × 1080 px stage, scaled to fill the window.
- CSS 3D: a container with perspective, a "world" with preserve-3d, each object placed with translate3d and rotations. The camera is a transform of the world, interpolated between keyframes with a smooth curve (Catmull-Rom), plus a slight sway.
- Everything is computed by a render(t) function, where t is the time in seconds. No automatic CSS animations: I must be able to jump to any moment.
- Easing functions (ease-out, ease-in-out, small bounce) for every entrance.
- One table for the captions (start, end, text) and one for the camera keyframes.
- Sound effects synthesized with the Web Audio API (pop = fast rising sine, whoosh = filtered pink noise, chime = soft notes), triggered at the right time.
- Keyboard controls: Space pause, R restart, arrows previous/next scene, S sound, C captions, H logo and clock, L loop, F full screen.
- A capture mode: if the URL contains ?capture&t=12, show the frame at 12 s directly.
- Important: never put opacity < 1, filter, overflow: hidden or will-change on a container that has 3D children (otherwise Chrome flattens the 3D).

Why each line matters

- **One file:** you open it with a double-click, even offline.
- **render(t):** you can ask "show me second 12" and fix things precisely.
- **The camera curve:** that's what makes it feel like a film instead of a slideshow.
- **The capture mode:** Claude can check its own frames, and so can you.
- **The last instruction** saves you from the bug that cost me the most time (see "The traps").

Step 5 — The back-and-forth, where quality happens

The first version won't be perfect, and that's normal: fixing is what makes it beautiful. Open the file in Chrome, watch it, and write down the seconds where something is off.

- To see an exact moment, add `?capture&t=12` at the end of the file's address in Chrome.
- If Claude Code can take screenshots itself, ask: "Take captures at 5, 12, 20 and 30 s and check that no text overlaps."

Feedback that works

"At 12 s, the chips pass over the email text: fade the email out when they come out."

"The camera is too far on the quote: bring it about 20% closer."

"Slow down scene 3, there's no time to read."

"Add a pop when each chip appears, a bit higher-pitched each time."

"The caption hides the bottom of the phone: move the camera up 50 px."

"On a phone, the text will be small: make the captions bigger."

Checklist before filming

- ☐ Everything is readable on a phone screen.
- ☐ No text cut off, hidden or overlapping.
- ☐ One idea per scene, a steady rhythm (about 5 seconds).
- ☐ The highlight is clearly visible.
- ☐ A clean ending: logo, name, call to action.

08 Step 6 — Filming

Filming the screen in the dark: that's what creates the glow around the panels.

- 1 Turn off the lights, set screen brightness to max, and clean the screen (smudges show on camera).
- 2 Open the file in Chrome, click "Play the demo": it goes full screen. Otherwise, press **F**.
- 3 Press **Space** to pause at the start.
- 4 Prop your phone (tripod or a stack of books), slightly angled, and lock focus and exposure (on iPhone: long-press the screen).
- 5 Start recording, then press **R**: the animation restarts cleanly from the beginning.
- 6 Do two or three takes, keep the best one, crop it in TikTok or CapCut.

💡 Using your own music? Press **S** before filming to mute the sound effects.

Step 7 — Posting

- **The hook in the first second**, as on-screen text. Mine: "Claude's new Motion design 🤖💡". Short, intriguing, with the word people search for.
- **A "motion design" track**, not too loud.
- **A pinned comment** with a keyword, to DM people who want to know more.
- **Reply to comments**, but never twice with the same sentence: TikTok treats identical replies as spam.

The traps I ran into

- **The 3D suddenly going flat.** A single opacity, filter, overflow: hidden or will-change on a 3D container and Chrome squashes everything flat. Only put them on elements with no 3D children.
- **Too much text on screen.** Eight words per caption, max. Nobody reads a paragraph on TikTok.
- **Elements overlapping.** Check every scene with the capture mode before filming.
- **Exporting the video frame by frame.** Very heavy: it crashed my computer. Filming the screen is simpler, and it looks better.
- **Pasting the same reply everywhere.** My identical comments got flagged. Always vary a little.

What you see in my video, I build for real.

My video isn't just an animation: it shows exactly what I build for small and medium businesses. **Custom business tools** and **automations** that do the repetitive work for you: incoming requests, client cards, quotes, reminders, scheduling...

Want to know what we could automate in your business? **30 minutes, free, no commitment.**
